|   |    |
|---|----|
| 1. Introduction.....                                | 3  |
| 1.1 Folder and File Structure.....                  | 3  |
| 1.1.1 What You Should Do.....                       | 4  |
| 1.1.2 Previewing Your Documentation.....            | 4  |
| 2. Basic Markdown Syntax.....                       | 4  |
| 2.1 Headings.....                                   | 5  |
| 2.2 Paragraphs and Line Breaks.....                 | 5  |
| 2.3 Bold and Italic Text.....                       | 5  |
| 2.4 Lists.....                                      | 5  |
| 2.4.1 Bullet (Unordered) List.....                  | 5  |
| 2.4.2 Numbered (Ordered) List.....                  | 5  |
| 2.4.3 Paragraphs Within List Items.....             | 6  |
| 2.4.4 Single-Item List Rendering Issue.....         | 6  |
| 2.5 Links and Images.....                           | 6  |
| 2.5.1 Link.....                                     | 6  |
| 2.5.2 Image.....                                    | 6  |
| 2.6 Code Blocks and Inline Code.....                | 7  |
| 2.6.1 Inline code.....                              | 7  |
| 2.6.2 Code block.....                               | 7  |
| 2.7 Tables.....                                     | 7  |
| 2.7.1 Simple (Pipe) Table.....                      | 7  |
| 2.7.2 HTML-style Table (for advanced layouts).....  | 7  |
| 2.8 Figures (with captions and layout).....         | 9  |
| 2.9 Showing Images in Multiple Columns or Rows..... | 9  |
| 2.9.1 Without Captions.....                         | 9  |
| 2.9.2 With Captions.....                            | 10 |
| 2.10 Page Breaks for .docx/.pdf Outputs.....        | 10 |
| 2.11 Equations.....                                 | 10 |
| 2.11.1 Inline Equations.....                        | 10 |
| 2.11.2 Display Equations.....                       | 11 |
| 2.12 Diagrams.....                                  | 11 |
| 2.12.1 Mermaid example.....                         | 11 |
| 2.12.2 Dot example.....                             | 11 |
| 2.13 Footnotes.....                                 | 12 |
| 2.14 Notebook Output Embeds.....                    | 13 |
| 3. Creating New Documentation.....                  | 13 |

|  |    |
|--|----|
| 3.1 Step 1: Start a New File.....                | 13 |
| 3.1.1 Option 1: Use a Template.....              | 13 |
| 3.1.2 Option 2: Create from scratch.....         | 13 |
| 3.2 Step 2: Understand and Use the Template..... | 13 |
| 3.3 Step 3: Add or Adjust the YAML Header.....   | 13 |
| 3.3.1 Field Descriptions:.....                   | 14 |
| 4. Importance of File Naming.....                | 14 |
| 5. Ready-Made QMD Templates.....                 | 15 |
| 5.1 ATBD Template.....                           | 15 |
| 5.2 PUM Template.....                            | 15 |
| 5.3 How to Use the Templates.....                | 16 |
| 6. Using Pandoc to Convert DOCX to QMD.....      | 16 |
| 6.1 What is Pandoc?.....                         | 16 |
| 6.2 When and How to Use It.....                  | 16 |
| 6.3 Basic Usage Example.....                     | 17 |
| 6.3.1 What this command does:.....               | 17 |
| 6.4 Where Are Media Files Stored?.....           | 17 |
| 6.4.1 Changing the Media Folder Name.....        | 17 |
| 6.5 Next Steps.....                              | 17 |
| 7. Default Styles and Options.....               | 18 |
| 7.1 Shared Styling Configuration.....            | 18 |
| 7.2 Theme.....                                   | 18 |
| 7.3 Table of Contents.....                       | 18 |
| 7.4 Customizing Per-Document Settings.....       | 18 |
| 8. Automatic Keywords Generation.....            | 19 |
| 8.1 How It Works.....                            | 19 |
| 8.2 What You Should Do.....                      | 19 |
| 9. Using RStudio with Quarto.....                | 19 |
| 9.1 Opening Your Project.....                    | 19 |
| 9.2 Editing QMD Files.....                       | 19 |
| 9.3 Managing Media Files.....                    | 20 |
| 10. Rendering Documentation.....                 | 20 |
| 10.1 Render to HTML.....                         | 20 |
| 10.2 Render to PDF via DOCX and LibreOffice..... | 21 |
| 10.2.1 Preview with DOCX Instead of PDF.....     | 22 |
| 10.3 Output Location.....                        | 22 |

|  |    |
|--|----|
| 10.3.1 About the _quarto.yaml File.....                  | 23 |
| 10.3.2 Recommended Setup for Efficient Editing.....      | 23 |
| 10.3.3 Rendering the Full Project.....                   | 23 |
| 11. Problems and Solutions.....                          | 23 |
| 11.1 Text Styling in DOCX.....                           | 23 |
| 11.2 Figure and Image Numbering.....                     | 24 |
| 11.3 Table Styling and Formatting.....                   | 24 |
| 12. Document Review and Git Workflow.....                | 25 |
| 12.1 Adding Documentation to Your Project.....           | 25 |
| 12.1.1 Step 1: Link the Base Repository.....             | 25 |
| 12.1.2 Step 2: Add the DOCS/ Folder to Your Project..... | 25 |
| 12.1.3 Step 3: Set Up Git Shortcuts.....                 | 25 |
| 12.1.4 Available Git Aliases.....                        | 25 |
| 12.2 Pushing Changes to Git.....                         | 26 |
| 12.3 Reviewing Documents.....                            | 26 |
| 12.4 Releasing Official Documentation.....               | 27 |

# 1. Introduction

This manual guides users through creating technical documentation for the Copernicus Land Monitoring Service using [Quarto](#). Quarto simplifies the process of writing professional documents in [Markdown](#), and converting them into **HTML** and **PDF** for nice publishing. The manual covers basic Markdown writing, document rendering, as well as the review, and publication process of technical CLMS documents. It also describes the project folder structure, template usage, and common mistakes to avoid.

## Note

You don't need to be a programmer nor an expert to use Quarto. If you've ever written a document in Microsoft Word, you'll be able to use Quarto with a bit of practice.

## 1.1 Folder and File Structure

This section explains how your documentation project is organized and where to put your files. The structure ensures consistency, simplifies maintenance, and allows documents to be rendered correctly in both your local project and the central Technical Library.

Below is the standard folder layout you'll see at the root of the DOCS/ directory in your project:

```
DOCS/
├── _meta/                # Scripts, config, and metadata (do not edit)
├── includes/             # Quarto include files (do not edit)
├── templates/           # Document templates (do not edit)
├── theme/               # Styling definitions (do not edit)
├── _quarto.yml          # Project-wide Quarto config
├──                       CLMS_your-product-one_ATBD.qmd
├──                       CLMS_your-product-one_ATBD-media/
├──                       CLMS_your-product-two_PUM.qmd
├──                       CLMS_your-product-two_PUM-media/
├──                       ...
└── CLMS_your-product-last_PUM.qmd
```

### 1.1.1 What You Should Do

- You simply need to **add your own .qmd files** in the DOCS/ directory.
- If your document uses charts, screenshots, or diagrams, create a **media folder** with the same base name as your document and a -media suffix.

Example:

```
DOCS/
├──
└── figure1.png          CLMS_your-product-one_ATBD.qmd
                        CLMS_your-product-one_ATBD-media/
```

- Do **not modify** the following folders: \_meta/, includes/, templates/, theme/. These are managed centrally.
  - o **templates/**  
This is where you'll find ready-to-use .qmd templates. There are templates for two document types:
    - **ATBD** (Algorithm Theoretical Basis Document)
    - **PUM** (Product User Manual)When you start a new document, copy the appropriate template from this directory. This ensures consistency in structure and formatting across all documents in the Technical Library.
- Styling and rendering will **automatically reflect** the structure and appearance defined by the central documentation project.

### 1.1.2 Previewing Your Documentation

To preview the full rendered documentation from your project, use:

```
git docs-preview
```

For more details on previewing and validating, see the final chapter of this manual.

## 2. Basic Markdown Syntax

Note

In addition to this guide and the official documentation, you can also explore the template .qmd files in the `templates` folder. These files include real examples of how to structure documents using Markdown and Quarto-specific syntax. They're a great reference when you're not sure how to format something.

Markdown is a simple way to format text using plain characters — no need for complicated tools or buttons. Quarto uses Markdown to let you write clean, readable documents that can be turned into HTML or PDF automatically.

This section shows the most useful Markdown elements you'll need when writing documentation. If you want to explore more, visit the official [Quarto Markdown guide](#).

## 2.1 Headings

Use the `#` symbol to create headings and organize your content. More `#` means a smaller heading level:

|                  |            |           |
|------------------|------------|-----------|
| <code>#</code>   | Title      | (Level 1) |
| <code>##</code>  | Section    | (Level 2) |
| <code>###</code> | Subsection | (Level 3) |

## 2.2 Paragraphs and Line Breaks

Just write text normally to create a paragraph. Leave an empty line between paragraphs.

To create a **line break** inside a paragraph, end the line with two spaces:

|                       |    |     |       |
|-----------------------|----|-----|-------|
| This                  | is | one | line. |
| This is another line. |    |     |       |

## 2.3 Bold and Italic Text

- *Italic* — use one asterisk or underscore: `*italic*` or `_italic_`
- **Bold** — use two asterisks: `**bold**`
- ***Bold and italic*** — use three asterisks: `***bold and italic***`

## 2.4 Lists

### 2.4.1 Bullet (Unordered) List

|   |         |     |
|---|---------|-----|
| - | Item    | one |
| - | Item    | two |
| - | Subitem |     |

### 2.4.2 Numbered (Ordered) List

|    |       |      |
|----|-------|------|
| 1. | First | step |
|----|-------|------|

## 2. Second step

## 1. Sub-step

## Important

Make sure to include a blank line between list items, and ensure they are correctly indented. This ensures proper rendering in .docx and .pdf outputs. Without these, list entries may merge, misalign, or render incorrectly.

### 2.4.3 Paragraphs Within List Items

To include a paragraph or a block of text as part of a list item, indent the paragraph to match the indentation of the list content. Also, make sure the paragraph follows the list item without a blank line, or it may break the list.

```
- This is the list item title.  
  This is a paragraph that belongs to the same list item.  
  It should be indented to align with the start of "This is a paragraph..."  
  
- Another item  
  With its own paragraph block.
```

### 2.4.4 Single-Item List Rendering Issue

When a list or sublist contains only one item, it can be incorrectly rendered in .docx or .pdf formats. In such cases, the item may appear in the wrong font or style.

To fix this, apply a custom style to the single list item. In the provided Word template, use the style named "NormalLine".

Here is how to apply it:

```
- step 1  
  - [step 1.1]{custom-style="NormalLine"}\
```

## Note

- The custom-style attribute ensures the correct formatting.
- Don't forget to include the backslash ( \ ) at the end of the line to prevent unwanted spacing or breaks.

## 2.5 Links and Images

### 2.5.1 Link

[Quarto website](https://quarto.org)

### 2.5.2 Image

Place image files in your media/ folder, and use:

![Alt text](media/image-name.png)

## 2.6 Code Blocks and Inline Code

### 2.6.1 Inline code

Use backticks (`) to highlight short code inside a sentence:

Use the ``render`` button to build your document.

Rendered result:

Use the `render` button to build your document.

### 2.6.2 Code block

Use triple backticks for larger code examples:

```
```python
print("Hello, world!")
```
```

Rendered result:

```
print("Hello, world!")
```

You can replace `python` with other languages like `bash`, `r`, or `json`.

## 2.7 Tables

Tables are a great way to present structured information. Below are two common ways to create them, along with rendered previews.

💡 If you like there are several table generators on the internet which can help you generating markdown or html tables.

### 2.7.1 Simple (Pipe) Table

```
| Name | Role | Status |
|-----|-----|-----|
| Alice | Developer | *Active* |
| Bob | Reviewer | **Pending** |
: Demonstration of pipe table syntax
```

Rendered result:

#### Demonstration of pipe table syntax

| Name  | Role      | Status  |
|-------|-----------|---------|
| Alice | Developer | Active  |
| Bob   | Reviewer  | Pending |

Make sure to align columns using `|` and `-`.

### 2.7.2 HTML-style Table (for advanced layouts)

```
```{=html}
<table style="border-collapse: collapse; width: 100%; font-size: 14px;">
  <thead style="background-color: #2c3e50; color: black;">
```

```
<tr>
  <th colspan="3" style="padding: 10px; border: 1px solid #ccc; text-align:
center;">
                                Document      Workflow      Overview
</th>
</tr>
<tr>
  <th style="padding: 8px; border: 1px solid #ccc;">Step</th>
  <th style="padding: 8px; border: 1px solid #ccc;">Task</th>
  <th style="padding: 8px; border: 1px solid #ccc;">Details</th>
</tr>
</thead>
<tbody
  style="background-color: #ecf0f1;">
  <tr>
    <td style="padding: 8px; border: 1px solid #ccc;">1</td>
    <td style="padding: 8px; border: 1px solid #ccc;">Initialize Project</td>
    <td style="padding: 8px; border: 1px solid #ccc;">Set up folder structure and
copy                                     base template</td>
</tr>
<tr>
  <td style="padding: 8px; border: 1px solid #ccc;">2</td>
  <td colspan="2" style="padding: 8px; border: 1px solid #ccc;">Create and
configure `\.qmd` file</td>
</tr>
<tr>
  <td style="padding: 8px; border: 1px solid #ccc;">3</td>
  <td style="padding: 8px; border: 1px solid #ccc;">Write Content</td>
  <td style="padding: 8px; border: 1px solid #ccc;">
    Add sections, insert media, and apply styles.<br>
    Use templates to ensure structure consistency.
  </td>
</tr>
<tr>
  <td style="padding: 8px; border: 1px solid #ccc;">4</td>
  <td style="padding: 8px; border: 1px solid #ccc;">Render Output</td>
  <td style="padding: 8px; border: 1px solid #ccc;">
    <ul style="margin: 0; padding-left: 20px;">
      <li>HTML for preview</li>
      <li>DOCX for formatting check</li>
      <li>PDF via automation</li>
    </ul>
  </td>
</tr>
<tr>
  <td colspan="3" style="padding: 8px; border: 1px solid #ccc; background-color:
#d1ecf1; text-align: center;">
    ☐ All steps completed – document ready for review
  </td>
</tr>
</tbody>
</table>
```

Rendered result:

| Document Workflow Overview |                                   |                                                |
|----------------------------|-----------------------------------|------------------------------------------------|
| Step                       | Task                              | Details                                        |
| 1                          | Initialize Project                | Set up folder structure and copy base template |
| 2                          | Create and configure `\.qmd` file |                                                |

| Document Workflow Overview                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |               |                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| Step                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Task          | Details                                                                                                                       |
| 3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Write Content | Add sections, insert media, and apply styles.<br>Use templates to ensure structure consistency.                               |
| 4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Render Output | <ul style="list-style-type: none"><li>HTML for preview</li><li>DOCX for formatting check</li><li>PDF via automation</li></ul> |
| ☑ All steps completed — document ready for review                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |               |                                                                                                                               |
| <b>Warning</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                                                                                                               |
| <p>Avoid using <b>nested tables</b> (a table inside another table) when writing documentation intended for DOCX or PDF output. While this might work in HTML, it often causes serious rendering problems in Word or during PDF conversion — such as layout breakage, invisible borders, or unreadable formatting.</p> <p>☑ Instead of nesting:</p> <ul style="list-style-type: none"><li>Reorganize the content into a simpler layout</li><li>Split one large complex table into two or more smaller tables placed one after another</li></ul> <p>This ensures your document remains clean, readable, and properly formatted across all output formats.</p> |               |                                                                                                                               |

## 2.8 Figures (with captions and layout)

You can add figures using this special block format:

```
!!!                                     {.figure}  
! [A short helpful diagram] (media/diagram.png)  
A      caption      for      the      figure.  
!!!
```

You can also use layout options, like `fig-align="center"` or `fig-width="80%"` in advanced cases.

More: <https://quarto.org/docs/authoring/figures.html>

## 2.9 Showing Images in Multiple Columns or Rows

Sometimes you want to display a group of images side by side or in a grid. This is useful for comparisons or visual overviews. The following approaches work well in both HTML and DOCX outputs, including when converting to PDF.

### 2.9.1 Without Captions

You can use a Markdown table to arrange images in multiple columns and rows:

```
| {width=120} | {width=120} | {width=120} |  
|-----|-----|-----|  
| {width=120} | {width=120} | {width=120} |
```

This creates two rows with three images each. Adjust the width as needed to fit your layout.

## 2.9.2 With Captions

To add captions under each image, simply include a row of text below each row of images:

```
| {width=120} | {width=120} | {width=120} |  
|:-----|:-----|:-----|  
| Caption 1 | Caption 2 | Caption 3 |  
| {width=120} | {width=120} | {width=120} |  
| Caption 4 | Caption 5 | Caption 6 |
```

This method keeps captions aligned with each image, and works across all output formats.

⚠ **Note:** Tables used for captions will show borders in DOCX and PDF outputs. Removing them requires custom styles in a reference DOCX.

## 2.10 Page Breaks for .docx/.pdf Outputs

In Quarto, using section breaks (like - - -) may not reliably produce a page break in .docx or .pdf outputs. Instead, to insert a page break that appears only in those formats, use the following block: that appears only in .docx or .pdf outputs, use the following block:

```
::: {.content-visible format=docx}  
````{=openxml}  
<w:p><w:r><w:br w:type="page"/></w:r></w:p>  
:::
```

This will ensure that the page break is included in the rendered Word or PDF document, but not visible in HTML or other formats.

## 2.11 Equations

Quarto supports mathematical equations using LaTeX-style syntax. You can add inline equations or display equations as blocks.

### 2.11.1 Inline Equations

Use single dollar signs  $\$ \dots \$$  for inline math:

The formula for the area is  $A = \pi r^2$ .

Rendered result:

The formula for the area is .

### 2.11.2 Display Equations

Use double dollar signs  $...$  to show a larger, centered equation block:

```
$$  
E                                     =                                     mc^2  
$$
```

Rendered result:

You can use most standard LaTeX math symbols and operators. For more examples, check the [Quarto math documentation](#).

## 2.12 Diagrams

Quarto supports diagrams using **mermaid** and **dot**. Just use a code block like this:

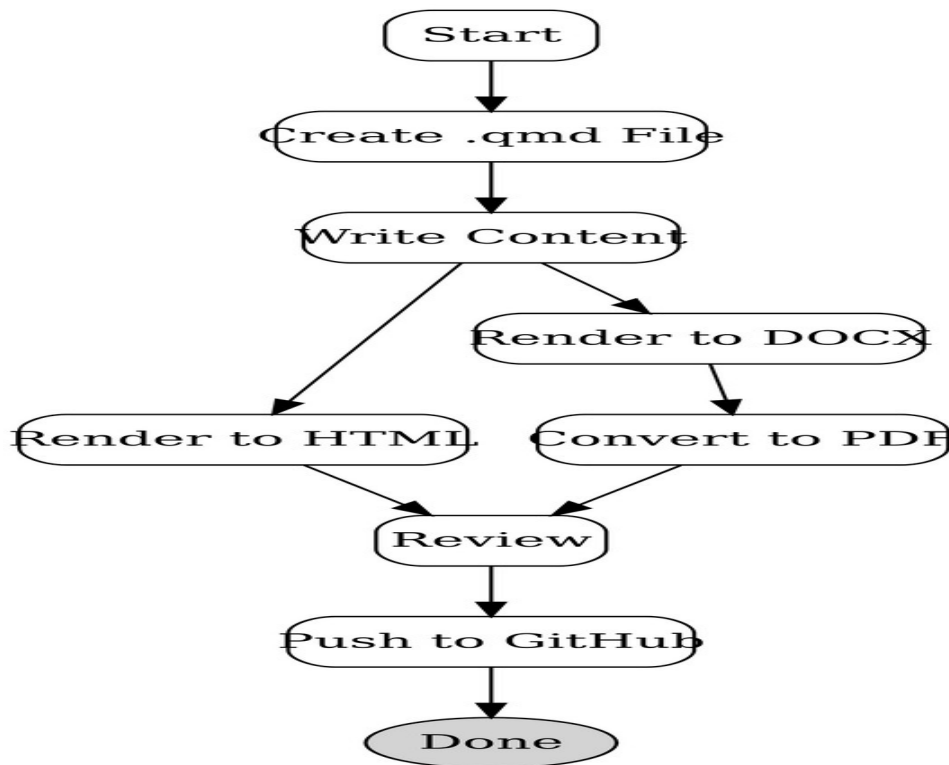

### 2.12.1 Mermaid example

```
```{mermaid}  
flowchart  
    A[Hard edge] --> B[Round edge]  
    B --> C{Decision}  
    C --> D[Result one]  
    C --> E[Result two]  
```
```

### 2.12.2 Dot example

```
```{dot}  
digraph LR  
    Start[Create  
Write  
Write] --> File1[Create  
.qmd  
Content  
Content]  
    File1 --> File2[Create  
File  
Render  
Render]  
    File2 --> File3[Create  
.qmd  
Write  
to  
to]  
    File3 --> File4[Create  
Content  
HTML  
DOCX]
```

More: <https://quarto.org/docs/authoring/diagrams.html>

## 2.13 Footnotes

You can add footnotes to explain details without interrupting the main text. Use `[^1]` where you want the footnote, and define the footnote at the bottom:

This is a sentence with a footnote.<sup>[^1]</sup>

[^1]: This is the footnote content.

Rendered result:

This is a sentence with a footnote.<sup>1</sup>

---

<sup>1</sup> This is the footnote content.

## 2.14 Notebook Output Embeds

If you're working with code notebooks (like Jupyter or R Markdown), you can include outputs such as plots or tables directly in the document. Quarto will automatically embed them after the code block.

More: <https://quarto.org/docs/authoring/notebook-embed.html>

# 3. Creating New Documentation

Creating a new document is simple when you follow a clear workflow. You can either start from a ready-made template or create a file from scratch.

## 3.1 Step 1: Start a New File

There are two ways to begin:

### 3.1.1 Option 1: Use a Template

1. Open the templates/ folder.
2. Choose the right template:
  - o CLMS\\_Template\\_ATBD.qmd for an Algorithm Theoretical Basis Document (ATBD)
  - o CLMS\\_Template\\_PUM.qmd for a Product User Manual (PUM)
3. Copy the template into the products/ folder.
4. Rename it to match your new document. Example: my-product.qmd
5. Create a new media folder named my-product-media/ next to it to store images and charts.

### 3.1.2 Option 2: Create from scratch

1. Inside the products/ folder, create a new file: e.g. my-product.qmd
  2. Create a new media folder named my-product-media/ for related images and figures.
- Using templates is recommended because they include structure and helpful comments. But starting from scratch gives you full control.

## 3.2 Step 2: Understand and Use the Template

Templates include:

- A pre-filled YAML header (the part at the top with ---)
  - Required sections and headings
  - Helpful comments you should keep while editing
- If you use an already defined template, the YAML header is included — you don't need to add it manually.

## 3.3 Step 3: Add or Adjust the YAML Header

If you're creating the .qmd file from scratch (i.e. not using one of the provided ATBD or PUM templates), you typically **do not need to specify the format field** manually. Quarto will automatically apply its default rendering format, which is sufficient in most cases.

However, if you need to customize the rendering outputs (e.g. to apply a specific DOCX style), then you **must define the format: field** carefully.

These fields are **required** for correct rendering:

- `format:` controls how your document is rendered (HTML, styled DOCX, PDF)

#### ! Important

You **must include** the `pdf:` default format in the YAML header. Although PDF is not rendered directly during this step, defining it here ensures compatibility with the automated rendering workflow later. Details are explained in the [Rendering Documentation](#) section.

If you override the `format` section, please follow these strict guidelines:

- Only modify the `format:` block.
- You must define all three output formats:
  - o `html:`
  - o `docx:` (with `reference-doc:` pointing to the style template)
  - o `pdf:`

Improper modifications can break the rendering process locally or in the central Technical Library. To see correct examples of a fully-defined format block, refer to the template files in `DOCS/templates/`.

Here's a basic header you can use:

```
---
title: "Product"                                SHORT      NAME
subtitle: "Product"                             full        name
date: "2022-10-06"
version: 1.0
template-version: 1.0.0
product-name: Product                           Name
description: "Product"                          DESCRIPTION
---
```

### 3.3.1 Field Descriptions:

- `title:` The main title of the document (displayed in the rendered output).
- `subtitle:` An optional second line of text under the title.
- `date:` The publication or last updated date.
- `version:` The version of your document (e.g. "1.0", "v2.3-draft").
- `template-version:` **Not rendered** — this is a special internal field that helps keep track of which template was originally used. Do not remove or modify this field unless you're updating the template version intentionally.

These fields must be filled in by the user. Only other fields — such as shared configuration or output format — are pre-filled in the template.

## 4. Importance of File Naming

Each `.qmd` file has a filename, like `my-document.qmd`, and this name plays an important role in how your documentation is organized and accessed online.

The filename (without the .qmd extension):

- Is used to generate the final HTML file name.
- Becomes part of the document's **URL** after publishing.

**Example:** If your file is named `products/data-guide.qmd`, the published URL will be `https://your-docs-site.org/products/data-guide.html`.

To avoid issues:

- Choose a clear, short, and consistent name when creating the file.
- Avoid renaming it later, as it can break links and references.
- Use lowercase letters and dashes (e.g. `product-user-manual.qmd`).

#### Important

Stick with the original name once created unless you have a strong reason and can update all links accordingly.

## 5. Ready-Made QMD Templates

To make documentation creation easier and more consistent, you can start your work from ready-made .qmd template files. These templates include the correct structure, required sections, and helpful comments to guide your editing.

Templates are stored in the `templates/` directory. Currently, two types of templates are provided:

### 5.1 ATBD Template

**Filename:** `CLMS``_Template``_ATBD.qmd`

This template is used for creating an **Algorithm Theoretical Basis Document (ATBD)**.

It includes:

- A structured outline based on standard ATBD requirements
  - Placeholder sections for theory, algorithm descriptions, validation, and references
  - YAML metadata pre-filled with necessary fields and style settings
  - Commented guidance within each section
- Use this template when documenting the scientific or technical foundation of a data product.

### 5.2 PUM Template

**Filename:** `CLMS``_Template``_PUM.qmd`

This template is used for creating a **Product User Manual (PUM)**.

It includes:

- Sections for product overview, data access, interpretation, and use
- Notes on where to insert images, tables, and figures
- YAML header configured for standard rendering

□ Use this template when documenting how users should interact with or interpret a product.

## 5.3 How to Use the Templates

1. Go to templates/
2. Choose either CLMS``\_Template``\_ATBD.qmd or CLMS``\_Template``\_PUM.qmd
3. Copy the file into the products/ folder
4. Rename it to match your project (e.g. my-product.qmd)
5. Begin editing based on the guidance in the template

If you're unsure which template to use, ask your team lead or check what was used in previous similar documents.

### ! Important

Do not modify the structure of the template unless absolutely necessary. Keeping the structure consistent across all documents ensures that the documentation system stays clear, professional, and easy to navigate for all users and reviewers.

## 6. Using Pandoc to Convert DOCX to QMD

When translating existing documents from Word (.docx) into Quarto Markdown (.qmd), you can use **Pandoc** to quickly generate a base file. This can save time by preserving text structure, headings, and even tables — though the result will still need cleanup.

### 6.1 What is Pandoc?

[Pandoc](#) is a powerful command-line tool that can convert documents between various formats, including Markdown, DOCX, HTML, LaTeX, and more.

To use Pandoc on your computer, download and install it from the official site: <https://pandoc.org/installing.html>

### 6.2 When and How to Use It

Use Pandoc **only** for converting existing .docx documents into .qmd. Do **not** use it to convert PDFs — Pandoc does not support PDF as an input format. This approach is ideal when you're:

- Migrating legacy documentation into the Quarto system
- Creating a quick starting point for manual cleanup

- Extracting embedded images and figures from .docx

## 6.3 Basic Usage Example

Open a terminal or command prompt — ideally from within **RStudio's Terminal tab** so you can stay in one environment — and run the following command. You can provide either a relative or full path to the .docx file:

```
$ pandoc my-doc.docx -o my-doc.qmd --wrap=none --from=docx --to=markdown+fenced_divs+grid_tables+pipe_tables+smart
```

### 6.3.1 What this command does:

- my-doc.docx: The input Word document.
- -o my-doc.qmd: Output file in Markdown format.
- --wrap=none: Prevents Pandoc from breaking long lines into multiple lines.
- --from=docx: Specifies that the input file is a Word document.
- --to=markdown+fenced\_divs+grid\_tables+pipe\_tables+smart: Sets output format and enables enhanced table and layout options.

## 6.4 Where Are Media Files Stored?

When Pandoc finds images or other media in the .docx file, it extracts them automatically into a new folder. By default, extracted media will be placed into a subfolder named `media/`, located next to your output .qmd file. This is created automatically and will contain all image assets referenced in the converted file.

### 6.4.1 Changing the Media Folder Name

You can change the default media folder name using the `--extract-media` option:

```
$ pandoc my-doc.docx -o my-doc.qmd --extract-media=custom-media-folder
```

#### Note

Pandoc will create a `media/` subfolder *inside* the folder you specify. For example, running the above command will result in:

```
custom-media-folder/media/
```

If you want to follow the structure expected by your project (e.g. `my-doc-media/`), make sure to move the contents **out of that inner `media/` folder** and place them in the right location manually.

## 6.5 Next Steps

After conversion, you'll likely need to:

- Clean up unnecessary styles or extra spacing
- Rename and organize media files
- Add a proper YAML header at the top of the .qmd file

- Restructure the content to match your template or documentation style

While not perfect, this method gives you a solid starting point — especially for long or complex documents.

## 7. Default Styles and Options

To make documentation look consistent and professional, we use a set of predefined styles and settings. These are applied automatically when you render your .qmd files, so you don't need to worry about design details — just focus on the content.

### 7.1 Shared Styling Configuration

Most formatting options (fonts, colors, spacing, margins, etc.) are defined in shared configuration files. These files are stored in `styles` directory and include:

- A custom DOCX file for styling PDF output
- A CSS stylesheet for HTML
- Metadata files for shared fields like project name, institution, and contributors

Don't edit them! — they're used automatically by the rendering scripts.

### 7.2 Theme

It ensures that all documents have a clean, modern, and consistent appearance — both in HTML and PDF output.

This theme is applied automatically. You do not need to configure it manually in your documents.

### 7.3 Table of Contents

The table of contents (TOC) is enabled by default and appears on the left-hand side in HTML documents.

You can control how many heading levels are shown by adjusting `toc-depth` in your YAML header, though the default setting (`toc-depth: 3`) is usually enough.

### 7.4 Customizing Per-Document Settings

If needed, you can override the default styles or add extra options in your document's YAML header. For example:

```
format:
  html:
    toc: true
    toc-depth: 3
    docx:
      reference-doc: ../styles/custom-reference.docx
  pdf: default
```

## 8. Automatic Keywords Generation

You do not need to manually add keywords to your document's metadata. The system is designed to handle this automatically using AI during the publishing workflow.

### 8.1 How It Works

- The default Quarto metadata configuration automatically injects a special placeholder value into the `keywords:` field in your document's header.
- When your document is rendered and processed for publication, an AI service analyzes its content and automatically generates **10 relevant keywords**.
- These keywords help with document indexing, search, and classification on the publication platform.

This process ensures consistent keyword formatting and reduces the work required from authors.

### 8.2 What You Should Do

Nothing!

Simply leave the `keywords:` field untouched or omit it entirely. The publishing system will take care of it for you.

If you do add custom keywords for internal purposes, they will be overwritten during the publishing step — so it's best to let the system manage them.

## 9. Using RStudio with Quarto

[RStudio](#) is the recommended tool for working with `.qmd` (Quarto Markdown) files. It provides a simple, user-friendly interface for writing, editing, and rendering documentation.

You don't need to know R to use RStudio — we only use it here as a Markdown editor with rendering features.

### 9.1 Opening Your Project

1. Open RStudio.
2. Use **File > Open Project...** and select the root folder of the Technical Library.
3. Navigate to the `products/` folder.
4. Open the `.qmd` file you want to edit.

### 9.2 Editing QMD Files

You can edit `.qmd` files just like regular text documents. RStudio provides:

- Syntax highlighting for Markdown and code blocks
- A live preview of rendered output
- Auto-saving and formatting support

- Instant feedback when rendering errors occur

Use the **Preview on Save** option (checkbox in the toolbar) to automatically render your file every time you save it. This makes editing more efficient.

## 9.3 Managing Media Files

If your document uses images or diagrams:

- Place them in a dedicated media folder (e.g. my-doc-media/)
- Use relative paths in your .qmd file, like:

```
![Data Flow Diagram](my-doc-media/diagram.png)
```

# 10. Rendering Documentation

Once your .qmd file is ready, the next step is to render it — this means turning it into a final document that can be published. Quarto supports multiple output formats, but in our workflow, we focus on: **HTML** and **PDF**.

You can render your documentation directly in RStudio as described below or using command-line tools, depending on what you prefer. Both options work the same way and produce identical results — choose the one that fits your workflow best.

## 10.1 Render to HTML

HTML is the default output format and is useful for previewing your document in a web browser while you work. Rendered HTML uses the custom Technical Library theme and includes a table of contents, clickable navigation, and consistent styles. It's a great way to check formatting, layout, and images as you write.

There are two ways to preview your .qmd file:

- Click the **Render** button at the top of the RStudio window.

- Or enable **Preview on Save** (in the RStudio IDE toolbar). This option automatically re-renders your document every time you save it.

After clicking the **Render** button (or saving the file with **Preview on Save** enabled), the HTML version of your document will appear in the **Viewer** tab, located in the **Output** pane (typically in the lower right corner of RStudio).

If the **Viewer** tab is not visible:

1. Go to **Tools > Global Options** in the top menu.
2. Navigate to the **R Markdown** section.
3. Ensure that **Show output preview in:** is set to **Viewer Pane**.

This setting ensures that rendered documents are displayed within RStudio, providing a seamless preview experience.

## 10.2 Render to PDF via DOCX and LibreOffice

PDFs are not generated directly by Quarto. Instead, the process involves a few automatic steps:

1. Quarto first generates a .docx (Word) file using the styles and settings defined in the YAML header and shared config files.
2. Then, a LibreOffice macro automatically converts the .docx to .pdf.
3. The resulting PDF file is saved in the output location.

This approach ensures consistent and well-formatted PDFs, even across different systems.

### Important

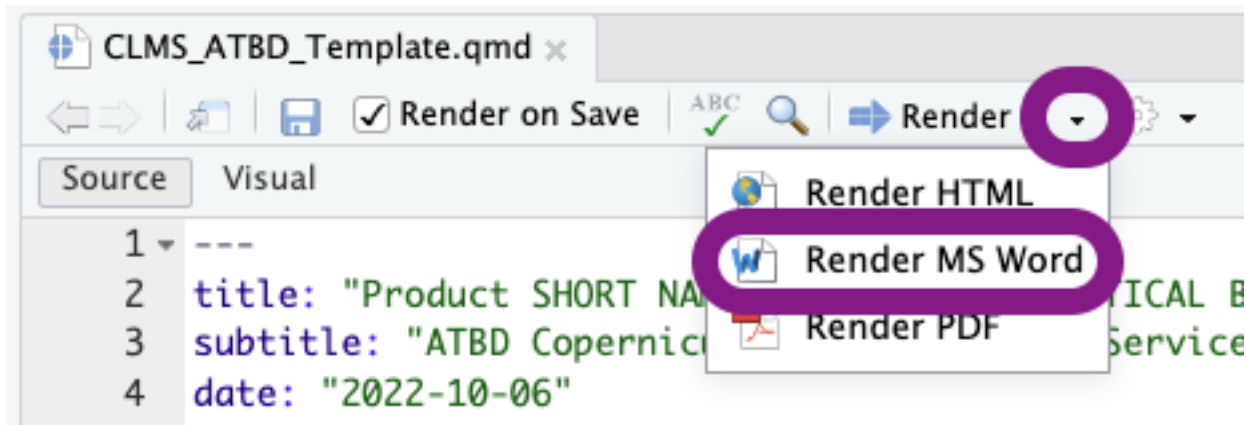

- Make sure pdf: default is included in your YAML header — this triggers the PDF pipeline.
- Do not define custom pdf: options unless you know what you're doing.

### 10.2.1 Preview with DOCX Instead of PDF

Instead of manually generating a PDF (which involves running scripts or waiting for the automated conversion), you can simply render a `.docx` file. It will look almost exactly like the final PDF because it uses the same styles and layout rules.

This is a great option when you want to quickly check how your document will look in PDF format — especially while you're still editing the `.qmd` file.

You don't need to change the order of output formats in the YAML header. Just click the **black arrow next to the Render button** in RStudio and select **"Render MS Word"** from the dropdown menu.

After rendering, the `.docx` file will automatically open in your default DOCX editor (e.g., Microsoft Word or LibreOffice Writer). If it doesn't open automatically, you can still find it saved in the **same folder as your `.qmd` file**, with the same base filename.

This approach is fast and avoids editing the YAML just to preview layout changes.

## 10.3 Output Location

When you render a single `.qmd` file locally (e.g. using RStudio or the command line), the output (HTML or DOCX/PDF) is saved next to your source file — usually inside the `products/` folder.

If you run the full command:

```
$ quarto render
```

then Quarto will build the entire Technical Library and save the results in a special `_site` folder. However, this is typically handled automatically by the rendering workflow in the GitHub repository during the publishing process.

□ You do not need to render the entire library yourself. Just focus on rendering the file you are currently working on. This keeps things faster and easier to manage during editing.

### 10.3.1 About the `_quarto.yaml` File

The `_quarto.yaml` file is a special configuration file that defines project-wide settings, including the default output folder — which is `_site`.

When this file is present in the root of your project, RStudio (and Quarto) assumes you're working in **project mode**. That means it tries to render the **entire site**, not just the file you're editing.

This can cause a few issues during local editing:

- Slower preview performance
- RStudio sometimes doesn't pick up the latest changes right away (likely due to caching)
- Viewer pane might not display fresh output

Unfortunately, this behavior isn't clearly documented — but it can be confusing and frustrating.

### 10.3.2 Recommended Setup for Efficient Editing

To avoid these issues, the repository includes a renamed config file: `_quarto-not-used.yaml`. This allows users to edit and preview individual files efficiently without triggering full-site rendering.

By default, this means:

- RStudio operates in “single file mode”
- Output files (HTML, DOCX) are written directly next to the `.qmd` file (e.g. in `products/`)

### 10.3.3 Rendering the Full Project

When you need to preview or build the entire Technical Library locally:

1. Rename `_quarto-not-used.yaml` to `_quarto.yaml`
2. Run:

```
$ quarto render
```

This builds the full site into the `_site/` folder as defined in the YAML config.

⚠ Working with `_quarto.yaml` in place during regular editing **can work**, but it may lead to slower performance or outdated previews in the Viewer pane. For a smoother editing experience, keep it renamed by default.

## 11. Problems and Solutions

This chapter describes common problems you might face while editing `.qmd` files and rendering documentation — along with practical solutions and best practices. These issues are based on real experience working with the templates and rendering workflow.

### 11.1 Text Styling in DOCX

#### Problem

You want to style or color specific parts of text in the final document, such as bolding only part of a sentence or changing its color.

## Solution

Use a **custom character style** from the template DOCX file. For example:

```
[**AD**]{custom-style="BoldRowText"}
```

This style (BoldRowText) is already defined in the template.docx file.

### Note

If you're adding a new style to the .docx reference file, make sure it's a **character style** so it works correctly when applied inline in .qmd files. Custom styles must always be defined as character styles — not paragraph styles. Using the wrong type can cause formatting issues across the entire document.

## 11.2 Figure and Image Numbering

### Problem

Figures and images inserted into .qmd files do not automatically include numbers in the rendered DOCX or PDF file.

### Workaround

You can use figure referencing like this:

```
![Short description](my-doc-media/image.jpg){#{fig-3 height=356px}}
```

However, this approach wraps the image in a table structure, which might cause visible borders or layout issues — especially if your styling is strict or minimal.

### Best Practice

For clean results:

- Add a manual figure number and title directly as text under the image.
- Avoid using automatic figure references unless necessary for cross-referencing.

Example:

```
![Diagram of processing flow](my-doc-media/flow-diagram.png)  
**Figure 3.** Data processing flow chart.
```

## 11.3 Table Styling and Formatting

### Problem

Only one table style is applied to all tables via the DOCX template, and additional formatting — like emphasizing specific rows — isn't applied automatically.

### Solution

Use a custom character style (like `BoldRowText`) within cells that require special formatting.

```
[**MRVPP**]{custom-style="BoldRowText"}
```

This will bold specific text while keeping the rest of the table structure intact.

### Best Practice

- Do not change the table structure or layout in the DOCX file manually.
  - Always apply row or cell formatting by using inline styled text directly in the .qmd source.
    - If you need to format a row differently (e.g. a header row within the body of the table), apply the style inline using the method above.
- 

More issues will be added here as the system and workflow evolve. If you encounter a formatting issue or rendering problem that isn't listed, ask your team lead or check how other documents handled similar cases.

## 12. Document Review and Git Workflow

### 12.1 Adding Documentation to Your Project

To integrate the documentation into your project, follow the steps below. Full instructions are available at: [https://github.com/eea/CLMS\\_documents\\_base](https://github.com/eea/CLMS_documents_base)

#### 12.1.1 Step 1: Link the Base Repository

Add the base documentation repository as a remote:

```
git remote add clms-docs-base git@github.com:eea/CLMS_documents_base.git
```

#### 12.1.2 Step 2: Add the DOCS/ Folder to Your Project

Use the following command to pull in the documentation as a subtree:

```
git subtree add --prefix=DOCS clms-docs-base main --squash
```

After running this, your project will include a DOCS/ directory containing all necessary documentation resources.

#### 12.1.3 Step 3: Set Up Git Shortcuts

To simplify documentation management, run the setup script:

```
./DOCS/_meta/scripts/setup-docs-aliases.sh
```

This will configure convenient Git aliases for working with the documentation.

#### 12.1.4 Available Git Aliases

Once the setup is complete, you'll have access to these useful Git commands:

- `git docs-update`: Syncs your local documentation with updates from the base repository.
- `git docs-publish`: Pushes your documentation changes to the repository.
- `git docs-preview`: Generates a local preview of your documentation.

These shortcuts make it easy to keep your documentation up-to-date, share changes, and review your work.

---

## 12.2 Pushing Changes to Git

Each project maintains documentation in its own `DOCS/` directory. When published to the Technical Library, your project's documents are available under a directory named after your project's Git repository name (`<PROJECT_NAME>`). These directories are managed as **git subtrees**, meaning their version history is isolated from the main repository for clarity and independence.

To publish updates to the central **Technical Library**:

1. Commit all your modified documentation files within your project repository:

```
git add DOCS/  
git commit -m "docs: update [brief description]"
```

2. Run the following command:

```
git docs-publish
```

3. This command merges your subtree changes into the `develop` branch of the central Technical Library repository.
4. After rendering, the updated Technical Library (develop version) becomes accessible at [https://eea.github.io/CLMS\\_documents/develop/index.html](https://eea.github.io/CLMS_documents/develop/index.html)

## 12.3 Reviewing Documents

The release of the complete Technical Library is controlled by the Technical Library owner.

1. The process begins with the creation of a **pull request (PR)** from the `develop` branch to the `test` branch.
2. This is a **pre-release** stage and is **not automated**.
3. When the PR is created, the **PR title is automatically generated** by GitHub Actions to conform to semantic commit format rules.
4. Only a **Technical Library owner** can create this PR.
5. Repository rules require that the PR must be reviewed and accepted by **at least one other Technical Library owner**.
6. Once the review is approved:
  - o The PR is merged.
  - o The preview (test) version is automatically rendered and published at [https://eea.github.io/CLMS\\_documents/test/index.html](https://eea.github.io/CLMS_documents/test/index.html)

## 12.4 Releasing Official Documentation

To publish the final release version:

1. A Technical Library owner must create a **PR from test to main**.
2. This PR also must be **reviewed and approved by another repository owner**.
3. Upon review approval:
  - o The PR is merged.
  - o The final, official version is automatically rendered and published at [https://eea.github.io/CLMS\\_documents/main/index.html](https://eea.github.io/CLMS_documents/main/index.html)

Version numbers for both pre-releases and official releases are **automatically generated** as part of the release workflow.
