6 How to Revert to a Previous Version	2

1 Step 1: Create Your Feature Branch

You can do this either through GitHub's website or using Git commands in your terminal:

1.1 Using GitHub (Easy Option):

- 1. Open GitHub and navigate to your repository.
- 2. Select the **test** branch from the dropdown menu at the top left.
- Click the button labeled **New branch** and name it clearly, for example, feature/new-document.

1.2 Using Command Line (Recommended for frequent users):

- Open your terminal or command prompt.
- Navigate to your local repository using:

cd path/to/your/repository

• Make sure your repository is updated:

git checkout tes git pull

• Create and switch to your new feature branch:

git checkout -b feature/new-document

2 Working on Documents

2.1 Suggested Editors:

RStudio: Easy integration with Quarto and Git.

- Visual Studio Code: Great support for Quarto documents.
- Any plain text editor you prefer.

2.2 Create or Edit Documents:

- Add new documents by creating .qmd files.
- Edit existing .qmd files directly in your chosen editor.

2.3 Commit Your Changes (Command Line):

Stage your changes:

git add .

• Commit your changes with a clear message:

git commit -m "Added introduction to the Privacy Guide"

Push your changes to GitHub:

git push origin feature/new-document

3 Publishing for Review (Test Environment)

3.1 Create a Pull Request (PR):

- 1. Go to your feature branch in GitHub.
- 2. Click on Compare & pull request.
- 3. Set the pull request destination to the test branch.
- 4. Provide a simple description of your changes and click **Create pull request**.

3.2 Review and Publish:

- Once your pull request is reviewed and approved by the team, it will be merged into the test branch.
- The merged content will automatically be published to the test GitHub Pages.
- View and review your documents by visiting the test pages link provided by your team.

4 Final Publishing to Main Environment

After reviewing and ensuring your documents are correct:

4.1 Merge to Main:

- 1. Create another pull request from the test branch to the main branch.
- 2. Clearly mention that the content is ready for final publishing.

4.2 Final Review and Approval:

- Your team reviews and approves the pull request.
- Once merged, the documents are automatically published to the main GitHub Pages for everyone to access.

5 Versioning

Every time new changes are published to the main branch, a version number is automatically assigned. You don't need to do anything—this happens behind the scenes to help track document versions clearly.

6 How to Revert to a Previous Version

If you need to go back to an earlier version:

- 1. Go to your repository on GitHub and click on **Tags**.
- 2. Find the version (tag) you want to revert to.
- 3. To revert locally using command line:

git checkout tags/v1.0

Replace v1.0 with your desired version.

4. If you want to make the reverted version the new main version again, create a new feature branch from this tag and follow the usual pull request workflow described above.
